

Condorcet Fusion: an implementation

Improved Retrieval through Rank Fusion

This project implements some ideas coming from a paper by **Aslam** and **Montague**.

These authors applied *Social Choice Theory* to **Rank Fusion**.

They claim that their algorithm beats the ones by **Fox** and **Shaw** most of the time.

Fox and **Shaw** devised some simple, score-based fusion formulae:

CombMAX

$$\text{fused score} = \max(\text{scores})$$

CombMIN

$$\text{fused score} = \min(\text{scores})$$

CombSUM

$$\text{fused score} = \text{sum}(\text{scores})$$

Fox and **Shaw** devised some simple, score-based fusion formulae:

CombMED

$$\text{fused score} = \text{median}(\text{scores})$$

CombANZ

$$\text{fused score} = \frac{\text{CombSUM}}{\#nonZeroScores}$$

CombMNZ

$$\text{fused score} = \text{CombSUM} \times \#nonZeroScores$$

Are we comparing apples and oranges?
